

TV4-203W

Specifications

System :	American TV standards
Channel coverage :	American VHF channels 2~13 American UHF channels 14~83 by using SONY UHF Converter
Picture tube :	4", 50-degree deflection, aluminized screen
Transistors :	31 (including Mesa and Epitaxial types)
Diodes :	17 (including Zener diode)
Silicon rectifier :	1 set
Resolution :	Vertical 350 lines, Horizontal 250 lines
Maximum sensitivity :	5 μ V/5 Vpp (in/out)
Automatic controls :	Pulse-operated AGC, Diode AFC Automatic Synchro-noise Suppressor
Speaker :	2" (5 cm), PM dynamic, 40 Ω
Audio output :	100 mW (undistorted)
Power requirements :	DC 12 V, 3.8 W AC 117 V, 50/60 cps, 6.2 W
Dimensions :	3-1/8" (H) \times 8-1/4" (W) \times 6-1/2" (D) (80 \times 210 \times 164 mm)
Weight :	5 lbs. 11ozs. (2.6 Kg) with battery
Glare proofing :	Smoked Filter, 70% Transparency

(Fig. 2)

The SONY Transistor TV4-203W

General

The SONY Transistor TV 4-203W is a 4 inch picture size which can receive American VHF Channel (2 through 13).

The design was made to meet the following requirements.

- 1) The Picture and Sound come on immediately when the set is turned on because of SONY's newly designed Picture Tube.
- 2) High performance tuner and newly developed Automatic Control Circuit assure clear picture and sound.
- 3) Can be operated with self-contained batteries, Rechargeable SONY Battery, car or boat battery or regular house current. The circuit layout is shown in Fig. 4.

Electronic Informations of Each Section

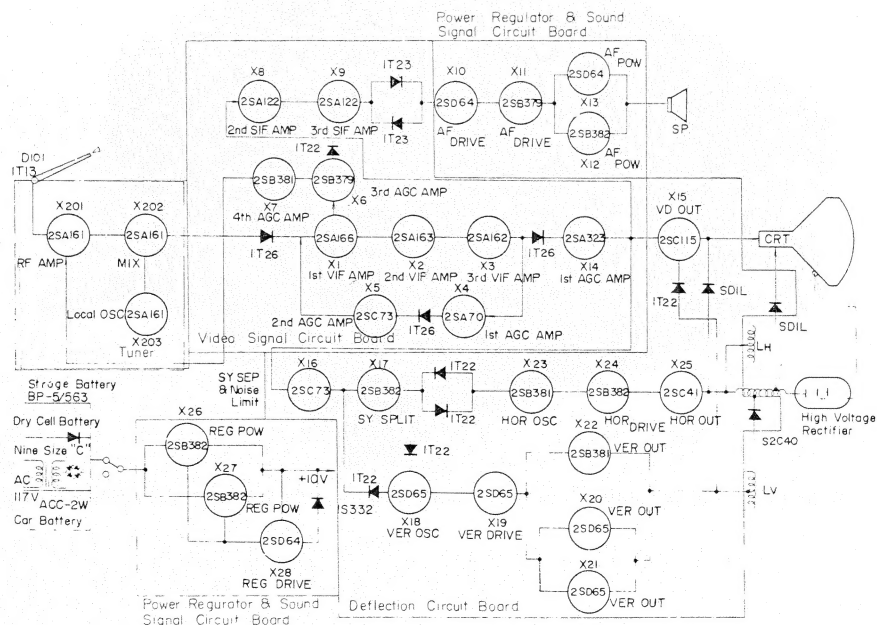

The Receiver is divided into the Tuner Block, Video Signal Block, Deflection Block, Power Regulator & Sound Signal Block, High Voltage Block and CRT Circuit Sections. Each section can be replaced with another spare section so as to facilitate the repair work.

(Fig. 3)

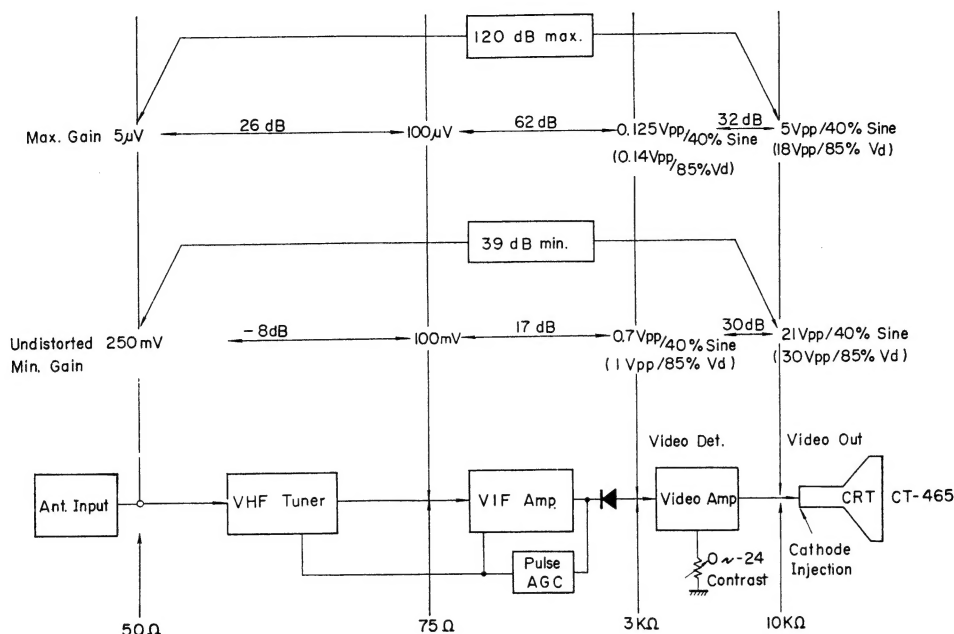

It consists of 31 transistors (including Mesa and Epitaxial Type), 17 diodes and 5 high voltage rectifiers.

Block Diagram

(Fig. 4)

Level Diagram for Video

Tuner Block

The Tuner uses three PNP Mesa Type Germanium Transistors (2SA161), one is used in the RF Amplifier, one is the Mixer and one in the Local Oscillator. A Disc Type Turret is used for mounting all the coils and contacts for Channel Selection. Special Contact Points have been designed for easy and positive channel selection. The transistors and other circuit parts are mounted directly above the Channel Switch and are enclosed within the Tuner Shield. RF coils for each channel are connected in series but the Oscillator Coil for each channel can be adjusted independently. The AGC characteristics of the set is excellent as the AGC action is extended to the IF Amplifier and to the RF Amplifier Stage in the VHF Tuner. The Set with the built-in Telescopic Antenna extended to its full length can be operated at a field strength of as much as 100 mV/m without overloading the circuit.

a. RF Amplifier

The Antenna Impedance is 75Ω. For correct impedance matching between the Antenna and the Transistor Input, taps are used on both sides of the tuned circuit. A tap on the Inductance is made on the Antenna side and a tap is made on the Capacitance on the Transistor side for impedance matching. The RF Transistor Output is double tuned with mutual coupling (double peaks). This in combination with the single peak of the input circuit gives essentially flat Bandwidth of 6 Mc for this stage.

A neutralizing capacitor is used in the base circuit as shown in Fig. 7-2 to prevent oscillation due to stray capacitance.

A gain of 14 dB is possible at 200 Mc with a circuit of this type but too much gain tends to make the Set unstable and hence the gain has been kept to be about 10 dB in our circuit. The gain on the lower channels tends to be higher than that on the higher channels, and so the damping resistors are inserted in the circuit of the lower channels to make the gain difference between the higher and lower channels within ± 1.5 dB.

VHF Tuner

(Fig. 6-1)

(Fig. 6-2)

(Fig. 7-1)

(Fig. 7-2)

b. Mixer Circuit

The Mixer Transistor 2SA161 is emitter-grounded. The Impedance Matching is made by a capacitance divider in the same way as in the RF Amplifier. The Local Oscillator Signal is injected into the base of the transistor. The power dissipation in the mixer transistor is very much less (about 1/30—1/50) than the plate loss of the tube mixer. The voltage of the Local Oscillator Signal injected is about 0.2 Vrms, which is also much smaller (1/10—1/20) than that in tube mixer. Furthermore, the Gm of the Transistor Mixer is high and hence the trouble with the mixer noise encountered in tube circuits are of no consequence here in our circuit. This circuit is also neutralized to prevent undesired oscillation.

c. Local Oscillator

The Local Oscillator uses a Colpitts Circuit. This circuit is well suited for this use as it does not require a tap on the oscillator coil. The transistor (2SA161) is base-grounded. The drift is kept within 200 Kc. As mentioned before, each oscillator coil is independent of the others so that the oscillation frequency can be adjusted from outside the Tuner by turning the screw type cores. The Fine Tuning Capacitors are separately shielded to prevent radiation from the set. The adjustable range of the Local Oscillation is approx. 1.8 Mc for Channel 2 and approx. 5.5 Mc for Channel 13.

Video Signal Block

The Video Signal Block includes Video IF, AGC Section and Sound IF Amplifier. The Video IF is 26.75 Mc while the Sound IF is 22.25 Mc. The Band Width of this section is 3 Mc which is sufficient for this type of miniature Receiver. All Transistors used in VIF stage are PNP Mesa type Germanium Transistor (X1, 2, 3...2SA161~6). The Video Signal which is amplified and detected by this section is fed to Video Output Stage located on Deflection Block through Video Drive Transistor (X14, PNP Germanium). Sound Signals which are picked up at collector of X14 because of Intercarrier System are amplified by two Sound IF Stages and Detected Audio Signals are fed to Audio Amplifier which is placed on Power Regulator & Sound Signal Block.

Deflection Block

The Deflection Block consists of the Video Output, Synchronizing Pulse Separator and Vertical and Horizontal Deflection Circuits. A NPN Mesa Type Silicon Transistor (X15, 2SC115) is used in the Video Output Circuit in order to get 30 Vpp of output which is required for sufficient contrast of Picture Tube. The frequency response is almost flat to 3 Mc by the use of shunted series peaking (L501, R510). The Synchronizing Pulse is separated at X16 (NPN, 2SC73) and Vertical Pulse is taken out of X16 Collector. This stage is operated as a Noise Limiter for the Synchronizing Pulse to keep stable condition in a car or any other place. The Vertical Saw-tooth wave is generated by blocking oscillation in the circuit of X18 (NPN, 2SD65). It is then amplified by X19, X20, X21 (NPN, 2SD65) and X22 (PNP, 2SB381) and applied to the Vertical Deflection Yoke of the Picture Tube. Vertical output is used B class push-pull circuit which consists of X21 (NPN) and X22 (PNP) Transistors. As a result, receiver does not need Vertical Choke Coil and power consumption of this stage is very low. The Horizontal Deflection Pulse is generated by Horizontal Blocking Transformer (HBT) and X23 (PNP 2SB381) then amplified by X24 (PNP, 2SB382) which drives output stage. The Horizontal Output Transistor (X25, NPN Silicon Mesa Type 2SC41) is connected to the Horizontal Output Transformer and supplies the Saw-tooth wave to the Horizontal Deflection Yoke.

High Voltage Block

High Voltage Block consists of the Horizontal Output Transformer and five High Voltage Rectifiers (1SK2). All are covered by one metallic case. Fig. 8 shows the inside of High Voltage Block and Deflection Yoke. The Flyback Pulse is stepped up, and rectified by the High Voltage Rectifiers to the High Voltage of about 8 KV, then applied to the Anode of the Picture Tube.

(Fig. 8)

Power Regulator & Sound Signal Block

Power Regulator & Sound Signal Block includes Power Regulator and Audio Amplifier. Power Regulator & Sound Signal Circuit which has three transistors (X26, X27, PNP 2SB382 and X28, NPN 2SD64) keeps a constant voltage against the alternating Power Voltage and Current (See Circuit Board Alignment).

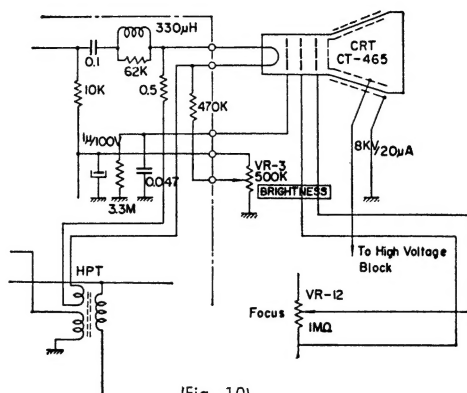

Detected Audio Signals through Volume Control (VR-1) are amplified by Audio Amplifier and supplied to Speaker. Direct Coupled Single Ended Push-Pull Circuit which requires neither Input nor Output Transformer is used at this audio power amplifier stage (X12, PNP 2SB382 and X13, NPN 2SD64). As a result, the size of audio amplifier is very small and audio power output is approx. 100 mW (non distorted) and maximum output is over 150 mW.

Picture Tube

The resolution of the picture greatly depends upon the construction of the Picture Tube, and the power consumption of the receiver is much influenced by the construction of the electron gun in the Tube. Therefore, the key point of success in making this type of Receiver is the improvement of picture tube. The CT-465 Picture Tube was specially developed for the SONY Transistor TV 4-203W and has the following features.

(Fig. 9)

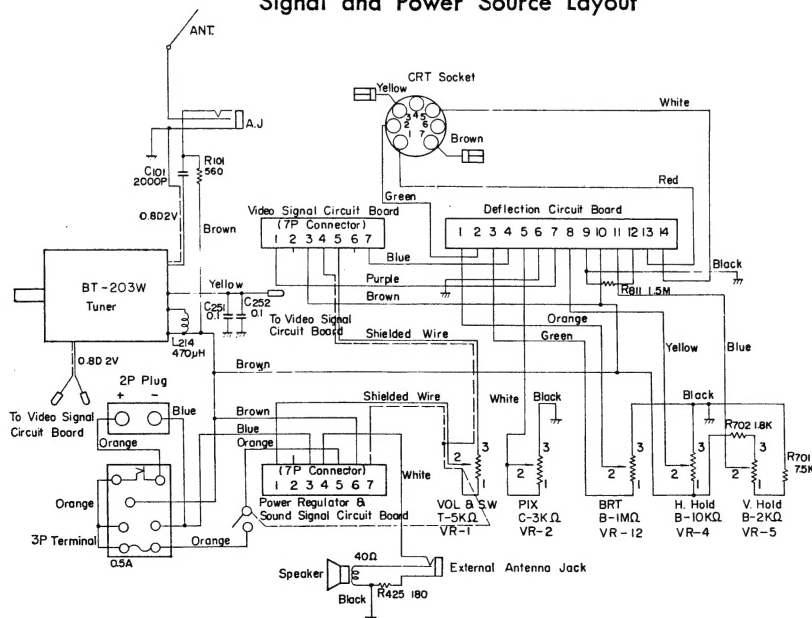

(Fig. 10)

- Cathode Direct Heating System by High Frequency Power is used to get the picture immediately when the set is turned on and High Frequency Power is supplied by Horizontal Pulse Transformer in Deflection Block. (See Fig. 10)
- Deflection Power
50 degree deflection and 12.75 mm neck diameter result in lower deflection power although the anode voltage is as high as 8 KV. This gives a brightness of 500 lux

Specifications of Picture Tube CT-465

Type :	Rectangular Frame	Focusing :	Electrostatic Automatic
Neck Diameter :	12.75 ± 0.35 mm	Full Length :	156 mm
Deflection :	Electromagnetic	Anode Voltage :	8 KV
Deflection Angle :	50 degree	1st Grid cut-off Voltage :	-20 ~ -30V
Heater Voltage :	0.58 V, 300 mA		

Signal and Power Source Layout

Method of Disassembling the Set

To Remove Cabinet Back (See Fig. 12)

1. Untie two screws for battery case and remove battery case.
 2. Remove two rubber foot screws and self tapping screw ($\oplus P 2.6 \times 6$) located on the rear of cabinet.
 3. Remove one philips head screws on the top of the cabinet.
 4. Remove two self tapping screws located on both side of the cabinet.
 5. Grasp cabinet front and cabinet back and remove cabinet back by pulling.
- Note:** Carrying handle must be held when cabinet is removed.

(Fig. 12)

To Remove Power Regulator & Sound Signal Circuit Board (See Fig. 13)

1. Remove one philips head screw ($\oplus P 3 \times 5$) at tuner side.
2. Remove two plastic clear screws ($\oplus P 3 \times 5$) located on the back of the chassis.
3. Pull PC Board to make free from receiver.
4. Disconnect 7P Plug by pulling and lift PC Board off receiver.

To Remove Video Signal Circuit Board (See Fig. 14)

1. Place receiver upside down.
2. Remove two philips head screws 2 and 3 in the Fig. 14.
3. Lift the Video Signal Circuit Board and pull straight up.
4. Disconnect yellow wire and black co-axial cable (VIF in) by pulling.
5. Disconnect 7-P plug.

To Remove Deflection Circuit Board (See Fig. 14)

1. Remove one screw (① in Fig. 14) located on cabinet front.
2. Lift the Deflection Circuit Board and pull it off from Multi-jack.
3. Disconnect yellow and brown wires from Picture Tube Socket, red, blue, orange and white leads from High Voltage Block, and green and gray from Deflection Yoke. Above wires are removed by pulling at the terminal tip on Deflection Circuit Board.

(Fig. 13)

To Remove Deflection Yoke (See Fig. 15)

1. Remove cabinet back and video signal circuit board.
2. Disconnect picture tube socket.
3. Loosen the yoke clamp screw.
4. Remove deflection yoke carefully as the picture tube neck is very weak.

(Fig. 14)

(Fig. 15)

To Remove Chassis Block (See Fig. 16)

1. Remove all the control knobs located on front panel by pulling.
2. Remove cabinet, video signal and deflection circuit boards.
3. Remove CRT anode plug from picture tube.
4. Remove deflection yoke.
5. Remove four screws ($\oplus K 2.6 \times 4$) located at the top bottom and left side of the cabinet.
6. Loosen lead wires between cabinet front and picture tube by pulling.
7. Remove external antenna jack from cabinet front by unscrewing jack nut.
8. Unsolder white earphone jack lead at jack terminal.

Caution: When removing the channel selector knob, pull the fine tuning knob together to avoid any damage against the channel selector knob.

To Remove Telescopic Antenna

1. Remove chassis and cabinet front. (See chassis and front cabinet disassembly)
2. Remove one philips head screw ($\oplus P 3 \times 5$) and spring washer.
3. Unsolder co-axial cable and resistor. (carbon fixed $27K\Omega$)

To Remove High Voltage Block (See Fig. 17)

1. Remove cabinet back.
2. Remove power regulator sound signal circuit board and deflection circuit board. (See power regulator and deflection circuit boards disassembly)
3. Unsolder red and blue leads at the terminal on deflection circuit board.
4. Disconnect orange and white leads by pulling them up.
5. Remove anode plug from picture tube.
6. Remove two screws ($\oplus P 3 \times 5$) located on the rear of high voltage block.

To Remove Tuner (See Fig. 17)

1. Remove chassis and cabinet front. (See chassis and front cabinet disassembly)
2. Disconnect shielded wire at the external antenna jack by unsoldering.
3. Remove two philips head screws 4 and 5 in Fig. 14 and lift the tuner block up temporarily, then remove it by pulling to the right of the receiver.

(Fig. 16)

(Fig. 17)

To Remove Picture Tube (See Fig. 18)

1. Remove cabinet front from receiver
2. Place cabinet front with picture tube on its safety cover (face down) and protect the safety cover with a cloth.
3. Remove long screw ($\oplus P 3 \times 25$) and nut at the picture tube clamp.
4. Remove picture tube clamp and clamp rod, and lift the tube up carefully.

Caution: If the picture tube has red mark on tube label (see Fig. 9), connect red wire from ist socket to the Multi-jack terminal No. 13, while in case of no red mark on tube label, connet red wire to the Multi-jack terminal No. 12.

The connection of Multi-jack terminal is as follows.

(Fig. 18)

(Fig. 19)

Adjustment and Alignment

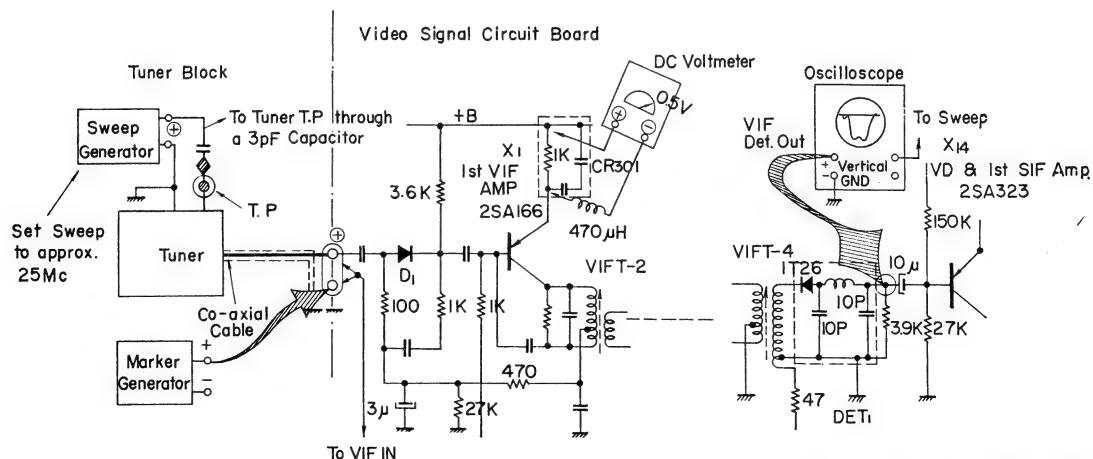

Video IF and Trap Alignment

Test Equipments

- Sweep Generator
- Marker Generator
- Oscilloscope
- DC Power Supply
- VTVM if available

1. Pre-Alignment Steps

1. Connect Sweep Generator to Tuner TP through 3pF Capacitor.
2. Set Sweep to approx. 25 Mc.
3. Couple Marker Generator to Video IF input.
4. Apply DC Voltmeter across 1000Ω in CR301 and get 0.5 V in DC Voltmeter by adjusting the Attenuator of Sweep Generator.
5. Connect the Oscilloscope to the Video Detector Output.

(Fig. 20)

2. Trap Alignment

1. Set Marker Generator to 22.25 Mc.
2. Tune Trap-1 (22.25 Mc) and get minimum dip
3. Set Marker Generator to 28.25 Mc.
4. Tune Trap-2 (28.25 Mc) and get minimum dip.

3. Video IF Alignment

1. Set Marker Generator to 23.45 Mc for VIFT2 adjustment, then 26.75 Mc for VIFT3 adjustment
2. Get Standard Response Curve as shown in Fig. 21 by adjusting VIFT2 and VIFT3.

VIF Alignment chart is as follows.

Adjusting Point	Center Frequency	Band Width	Damping Resistors
VIFT 1 (built in Tuner)	24.3 Mc	3 Mc	
2	23.6 Mc	1 Mc	R305
3	26.3 Mc	1 Mc	R313
4	25.5 Mc	3 Mc	
5	26.75 Mc	3.8 Mc	

[Fig. 21]

Distribution of VIFT, SIFT & Detector Block

4. Sound IF Alignment

Test Equipments

Sweep Generator
Marker Generator
Oscilloscope
Power Supply
VTVM

Standard Response for Sound Detector

[Fig. 22]

Connections (Refer to Fig. 23)

- Step 1. Set SSG to 4.5 Mc (AM 1,000 \circ /s, 30% Modulation) and get the minimum voltage of meter by adjusting Trap-3.
- Step 2. Adjust SIFT1, 2 and 3 so as to get the S shaped wave shown in Fig. 22.

(Fig. 23)

Deflection Block Alignment

Following check and alignment are necessary when Deflection Circuit Board is replaced.

(1) CRT Heater Voltage Alignment

Test Equipment

Thermoelectric Voltmeter

Voltage across the heater terminal of picture tube must be less than 0.60 V (Connection, see Fig. 24).

If above voltage is more than 0.60 V, adjust resistor R511 so as to get less than 0.60 V.

(2) Vertical Height, Vertical Linearity, and Vertical Bias Controls.

Test Equipment

Volmeter (20 KΩ/V)

- Set Deflection Circuit Board to Receiver and get normal Test pattern by adjusting VR-8 (Vertical Linearity) and VR-7 (Vertical Width).

(Fig. 24)

Caution

Voltage between the collectors of X20 & X21, and +10 V line should be $3.8\text{ V} \pm 0.2\text{ V}$. Voltage across emitter resistor (R711) of X22 (2SB381) should be $0.17\text{ V} \sim 0.18\text{ V}$. If not, adjust Vertical Bias Control (VR-9, 10).

Make sure no Retrace Line or white Vertical Bars on Raster present.

Horizontal width Adjustment

Set the Brightness to maximum by adjusting brightness control knob located on front panel and make sure horizontal width is normal. If not, add small value of capacitor (approx. $0.01 \sim 0.001 \mu\text{F}$) to C804 and get normal width.

Caution Recheck CRT heater voltage after the above adjustment.

Focus Adjustment

Connect DC Voltmeter as indicated below (Fig. 25) and get $2.4 \text{ V} \sim 2.6 \text{ V}$ in meter by adjusting Brightness Control Knob. Then adjust Semi-fixed Resistor (VR-12) so as to get the sharpest and the clearest picture.

(Fig. 25)

Power Regulator Board Alignment

Test Equipments

DC Power Supply

DC Voltmeter

DC Ammeter

Connection (refer to Fig. 26)

Apply 12 V DC in input and adjust VR-13 ($5 \text{ K}\Omega$) so as to get $10 \text{ V} \pm 0.2 \text{ V}$ in output.

Adjusted Power Regulator Board should satisfy the following features

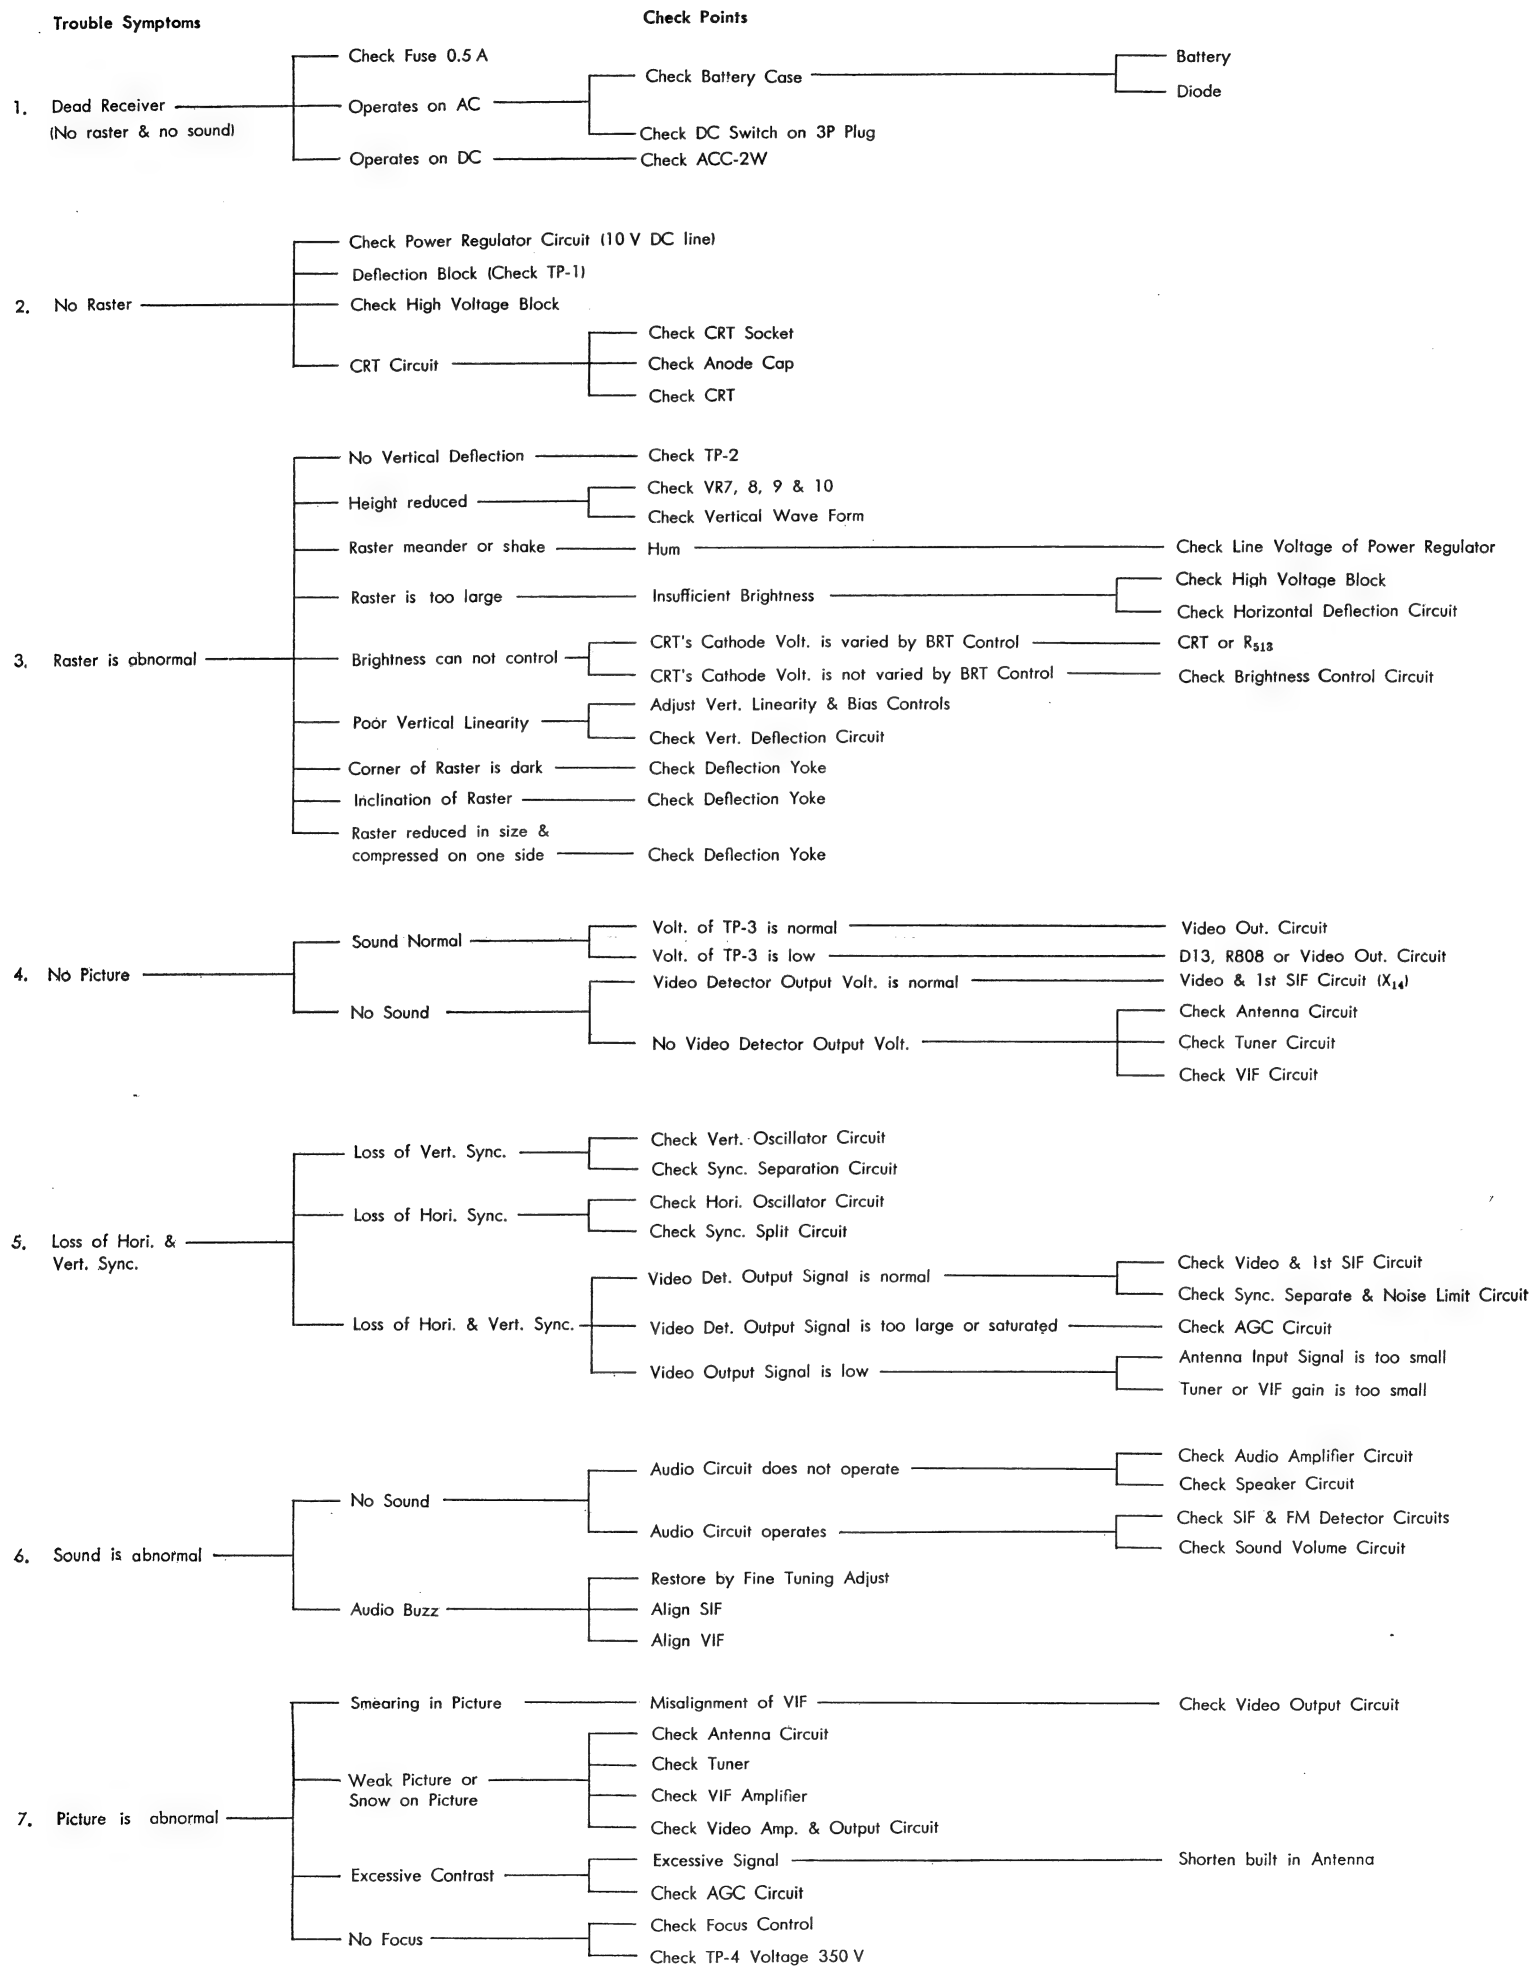

- (1) When the input voltage is set 12 (Twelve Volts DC) and output current is changed from zero to 100 mA by adjusting output load, output voltage of this board should be held between 10 V and 10.6 V
- (2) Set the Input at 12 V and the Output Current at 370 mA, then change the Input from 10 V to 14 V DC under the condition of constant load. The Output Voltage should be maintained between 9.7 V to 10.3 V.

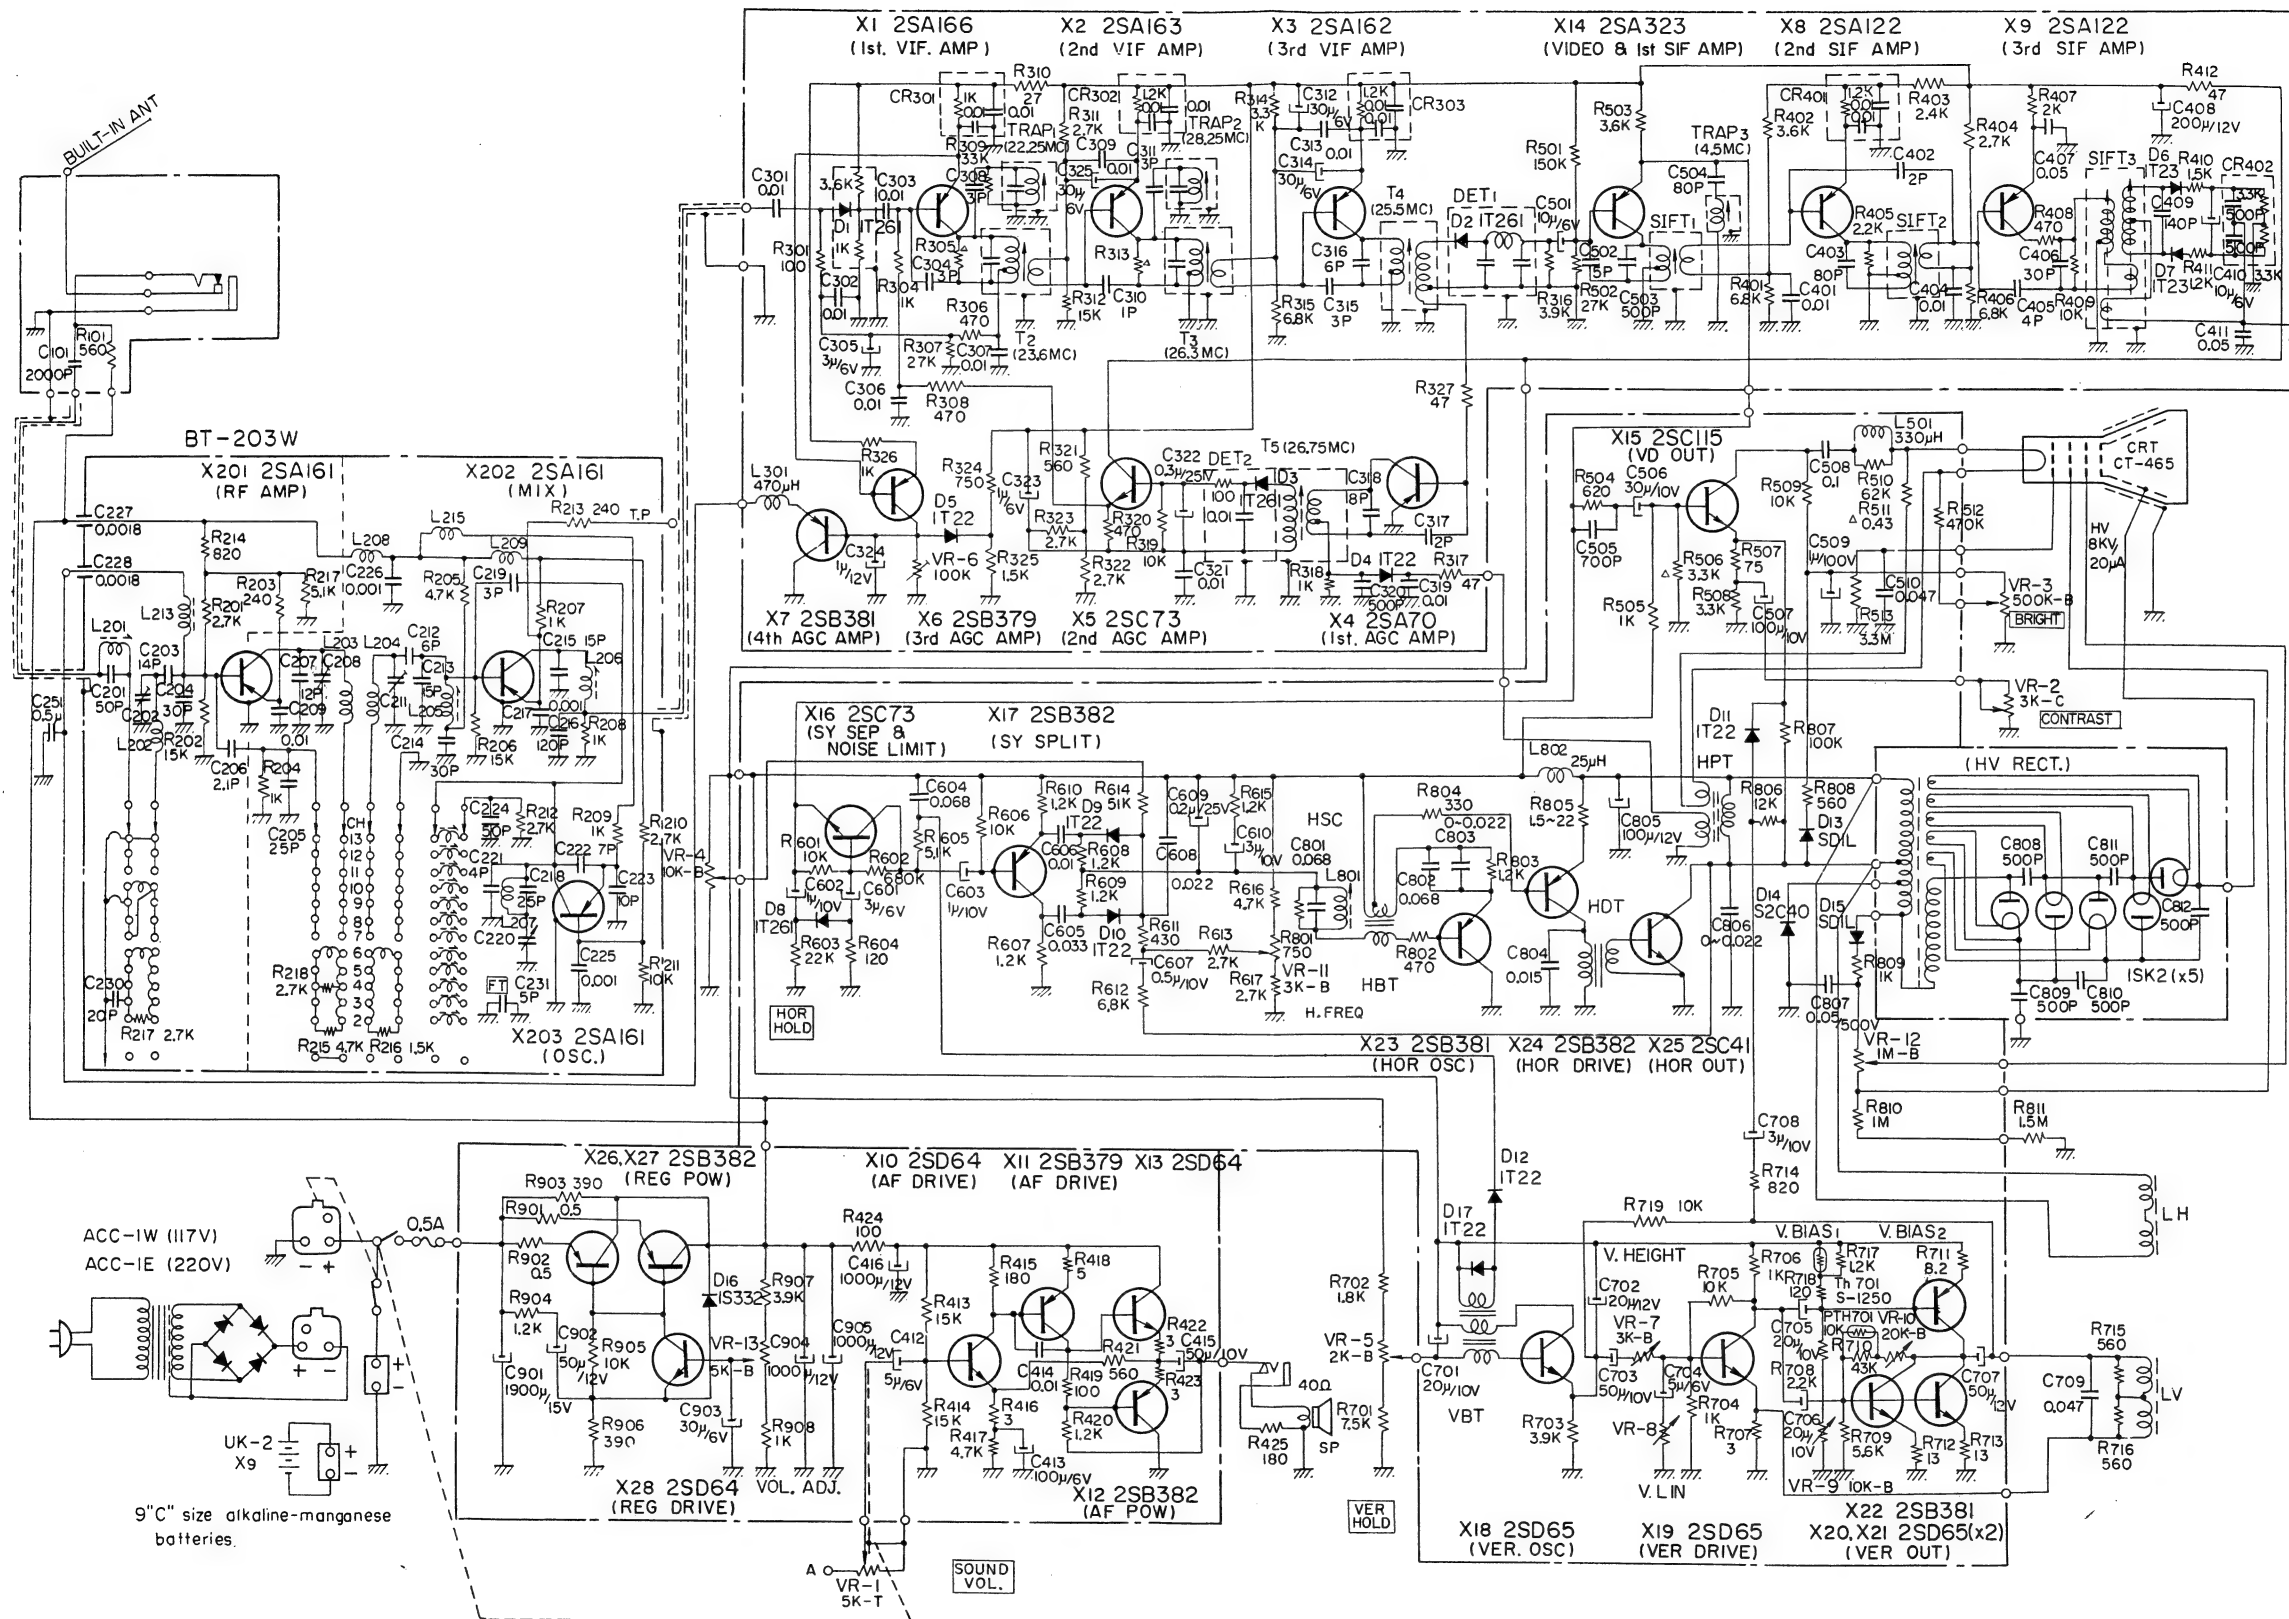

(Fig. 26)

Trouble Shooting

As described before, the receiver is divided into the Tuner Block, Deflection Block, Power Regulator & Sound Signal Block, High Voltage Block & CRT. Each section can be replaced with another spare section so as to facilitate the repair work. The following table shows the various trouble symptoms, the points to be checked and the necessary steps of repairing.

-975-02	Yoke Mounter	(1)	1-201-455-00	Composition Resistor 1.5 M Ω , 1/2 W	(2)
1-536-058-11	Connector Tip (F)	(4)		R _{909, 910}	(2)
7-621-309-55	Screw F 2.6 \times 8	(3)	1-501-047-21	Shoulder Strap Antenna, including	1
	Eyelet 2 \times 2	(6)	X-40038-24-1	Hook Assembly	(2)
1-105-721-11	Mylar Capacitor 0.047 μ F 100 WV	(1)	4-003-930-01	Connection Cord with Plug	(1)
			4-004-327-01	Tag	(1)
			Y-44017-02-3	External Antenna Connector EAC-4	1

Mechanical Parts List

Part No.	Description	Q'ty	Part No.	Description	Q'ty
A. General					
Cabinet & Appearance Items					
X-40038-03-1	Front Panel Assembly, including	1	4-003-857-01	Lid Cushion	(2)
4-003-809-02	Mask	(1)	-858-01	Lid Screw	(1)
-810-01	Panel (left)	(1)	4-004-307-01	Battery Name Plate	(1)
-811-01	Panel Spacer (left)	(1)	-960-01	Specification Label	1
4-004-812-02	Panel (right)	(1)	Main Chassis Block		
4-003-941-02	Panel Spacer (right)	(1)	X-40038-13-2	Chassis Assembly, including	1
-813-01	Picture Tube Escutcheon	(1)	4-003-860-02	Chassis	(1)
X-40038-05-1	SONY Badge Assembly, including	1	-861-01	Post for Battery Pack	(1)
4-003-814-01	Badge Mounter	(1)	-862-01	Post for Signal Circuit Board	(1)
-815-01	Badge "SONY"	(1)	-893-01	Bracket for Multi-Jack	1
4-003-816-01	Front Frame	1	-864-01	Tuner Mounting Plate	1
-817-01	Pull Rod Mounter (A)	2	-865-01	Screw for 2-P Plug	1
-818-01	// // // (B)	2	-961-02	Screw for 2-P Plug (Large)	1
0-209-526-01	Speaker Mounter	2	-984-01	Black Insulating Tape for Signal Circuit Board	1
4-003-819-01	Picture Tube Protector	1	4-002-786-00	Insulating Tape	1
-820-01	Picture Tube Clamp	1	Deflection Block		
-821-01	Pull Rod for Picture Tube	4	4-003-801-01	Heat Sink for Hori. Out. Transistor (2SC41)	1
X-40038-06-4	Cabinet Back Assembly, including	1	-951-01	Heat Sink for Vert. Out. Transistor (2SB381)	1
4-003-822-03	Cabinet Upper Part	(1)	-656-01	Heat Sink for Vert. Out. Transistor (2SD65)	2
-823-02	Cabinet Lower Part	(1)	-803-01	Black Sheet on Deflection Circuit Board	1
-824-02	Joint for Cabinet	(2)	Power Regulator & Sound Signal Block		
-825-02	Badge "SONY"	(1)	4-003-804-01	Heat Sink A	1
X-40038-19-1	Carrying Handle Assembly, including	1	-805-01	// // B	1
4-003-826-01	Handle	(1)	-806-01	Mylar Tape (Small)	1
-834-01	Leather for Handle	(1)	-807-01	// // (Large)	1
-827-01	Stand Lock Gear (Stator)	2	-808-01	Insulator for Electrolytic Capacitor	1
-828-01	Stand Lock Gear (Rotor)	2	-656-01	Heat Sink for Transistor (2SD64)	2
-829-01	Wave Washer	2	-953-02	Black Sheet on Power Supply Board	1
-830-01	Handle Shaft	2	Carton and Accessories		
-831-01	Nut for Shaft	2	4-004-319-01	Styro-foam Cushion (A)	1
-832-01	Screw for Shaft	2	X-40038-85-1	Styro-foam Cushion B Assembly, including	1
-833-01	Cover for Washer	2	4-004-320-01	Styro-foam Cushion (B)	(1)
4-002-730-00	Rubber Foot	2	4-003-988-01	Styro-foam Label	(1)
4-003-835-01	Telescopic Antenna Bushing	1	-998-01	Carton Sleeve	1
X-40038-07-2	Fine Tuning Knob Assembly, including	1	-323-02	Sheet for Carton	1
4-003-836-02	Fine Tuning Knob	(1)	-999-01	Master Carton for 4 sets	1/4
-250-01	Spring	(1)	-880-02	Polyethylene Bag	1
X-40038-36-1	Channel Selector Knob Assembly, including	1	-942-01	Hood	1
4-004-837-03	Channel Selector Knob	(1)	4-495-041-10	Instruction Manual	1
-958-01	Face Plate	(1)	X-40038-49-1	Caution Tag Assembly, including	1
4-003-839-01	Spring	(1)	4-003-966-01	Caution Tag	(1)
-840-02	Control Knob	4	4-498-005-01	Instruction (Adjustment)	(1)
-841-02	Volume Control Knob	1	4-003-883-01	Inspection Card	(1)
-842-01	Leather Spacer for Knobs	5	4-004-333-01	Accessory Case	1
X-40038-09-1	Front Cover Assembly, including	1	X-44900-02-1	Polishing Cloth	1
4-003-843-01	Front Cover	(1)	B. Screws & Washers		
-980-01	Front Cover Cushion	(1)	Circuit Board Block		
-844-01	Bracket "A" for Hood	(1)	7-621-559-25	Screw + K2.6 x 4 for Deflection Circuit Board	1
X-40038-10-1	Bracket Assembly for Hood	(1)	-261-29	Screw + P3 x 4 (Polycarbonate) for Power Supply Board	2
X-40038-11-5	Battery Case Assembly, including	1	-35	Screw + P 3 x 5 for Power Supply Board (1)	3
4-003-848-01	Battery Case	(1)		Heat Sink (2)	
-849-01	// // (Back)	(1)	-255-35	Screw + P 2 x 5 for Heat Sink	2
-850-01	Battery Contactor	(7)	-261-25	Screw + P 3 x 4 for Video signal Circuit Board	2
	(Positive & Negative)	(2)	-55	Screw + P 3 x 8 for Heat Sink	2
-851-01	// (Negative)	(2)	7-623-408-02	Star Washer 3φ for Heat Sink	2
-852-01	// (Positive)	(2)	7-622-108-02	Nut 3φ	2
-853-02	Battery Case Clamp Screw L	(1)			
-854-02	// // // // S	(1)			
-855-01	Spring for Screw	(2)			
-949-01	Battery Spacer	(9)			
-856-01	Battery Case Lid	(1)			

—continued—

Part No.	Description	Q'ty	Part No.	Description	Q'ty
7-623-205-12	Spring Washer 2 ϕ for Heat Sink	2		Nut 2 ϕ	6
	Cabinet & Appearance Block		7-624-103-01	Retaining Ring E-4 for Battery Case	2
7-621-720-22	Self Tapping Screw +K 2 \times 5 for SONY		7-624-104-01	Retaining Ring E-2 for Battery Lid	1
	Badge	2	7-623-305-02	Internal Star Washer 2 ϕ	2
7-621-259-72	Self Tapping Screw +P 2.6 \times 6	1	-307-02	" " " 2.6 ϕ for Speaker	1
	for Cabinet Lower Part		-207-11	Spring Washer 2.6 ϕ for Speaker	2
-722-41	Self Tapping Screw +P 3 \times 6 for		-507-01	Solder Lug 2.6 ϕ	1
	Cabinet Lower Part	2		Chassis	
-259-25	Screw +P 2.6 \times 4 for Speaker (2)	10	7-621-259-25	Screw +P 2.6 \times 4 for 3 P Terminal	2
	Cabinet Mask (4)		-261-35	Screw +P 3 \times 5 for High Voltage	7
	Picture Tube (4)			Block (2)	
-262-55	Screw +P 3 \times 25 for Picture Tube Clamp	1		Antenna Mounter (1)	
-559-25	Screw +K 2.6 \times 4 for Chassis	4		Multi-Jack (2)	
-259-29	Screw +P 2.6 \times 4 for Cabinet Upper			Tuner Mounter (2)	
	Part	1	7-623-208-12	Spring Washer 3 ϕ	3
-555-25	Screw +K 2 \times 4	6		Nut 3 ϕ	2
-770-44	Screw +B 2 \times 5	5		Tuner Block	
-559-45	Screw +K 2.6 \times 6 for 2 P Jack	2	7-621-261-35	Screw +P 3 \times 3 for Tuner	3
	Nut 3 ϕ	1
